# Part I

## Overview and Architecture

# Chapter 1

## Introduction

### 1.1 Context

In the current landscape of distributed information systems, log production has become exponential. These logs originate from multiple sources: web applications, microservices, databases, IoT systems, servers, APIs, and more. This massive amount of data constitutes a goldmine of crucial information for several strategic objectives:

- **Incident Detection and Diagnosis:** Quickly identifying anomalies and system failures
- **Performance Analysis:** Optimizing response times and user experience
- **Security and Compliance:** Detecting intrusions and respecting regulations (GDPR, PCI-DSS)
- **Business Intelligence:** Making decisions based on user behavior analysis

However, manual management of millions of log lines quickly becomes impossible. It is therefore necessary to implement an automated infrastructure capable of collecting, indexing, searching, and visualizing this data in real-time.

### 1.2 Problem Statement

Modern enterprises face the following challenges:

1. Logs are dispersed across different servers and applications
2. The lack of centralization makes problem diagnosis long and complex
3. Technical teams waste time manually searching through log files
4. There is no automatic alerting system for critical events
5. Visualization of trends and patterns is non-existent

## 1.3 Project Objectives

This project aims to design, develop, and deploy a complete log monitoring and analysis platform that addresses enterprise needs. The platform must:

1. **Centralize** log collection from different sources
2. **Intelligently index** data for ultra-fast search capabilities
3. **Provide relevant visualizations** to facilitate analysis
4. **Offer an intuitive web interface** for technical and business teams
5. **Be easily deployable and scalable** through containerization

## 1.4 Chosen Scenario: SaaS Web Application

For this project, we selected **Scenario D: SaaS Web Application**. This scenario involves developing a monitoring platform for a Software as a Service (SaaS) application used by thousands of client companies.

### 1.4.1 Types of Logs Processed

- **Web Server Logs:** Apache/Nginx access and error logs
- **Application Logs:** Flask exceptions, warnings, and debug messages
- **Database Logs:** Slow queries, deadlocks, and errors
- **Performance Logs:** Response times, memory/CPU consumption
- **API Logs:** Endpoints called, parameters, response codes

### 1.4.2 Key Performance Indicators (KPIs)

KPI	Description
Error Rate by Service	Percentage of failed requests per service
Average Response Time	Mean API response latency
Slowest Endpoints	Top endpoints by response time
Errors per Hour	Error frequency tracking
Active Users	Monthly Active Users (MAU)

Table 1.1: Key Performance Indicators for SaaS Monitoring

### 1.4.3 Priority Use Cases

1. Alert technical teams in case of abnormal error spikes
2. Identify slow SQL queries to optimize the database

3. Track API usage to anticipate scaling needs
4. Generate SLA compliance reports for clients
5. Provide real-time dashboards for operations teams

## 1.5 Document Structure

This technical documentation is organized into three main parts:

**Part 1: Overview and Architecture** Presents the global system architecture and detailed component descriptions

**Part 2: Technical Specifications** Details the technologies, modules, configurations, and data models

**Part 3: Guides and Validation** Provides installation, user guides, testing results, and future perspectives

# Chapter 2

## Global Architecture

### 2.1 System Overview

The SaaS Monitoring Platform is built on a microservices architecture using containerization for easy deployment and scalability. The system integrates the ELK Stack (Elasticsearch, Logstash, Kibana) with a Flask web application, MongoDB for metadata storage, and Redis for caching and real-time messaging.

### 2.2 Architecture Diagram

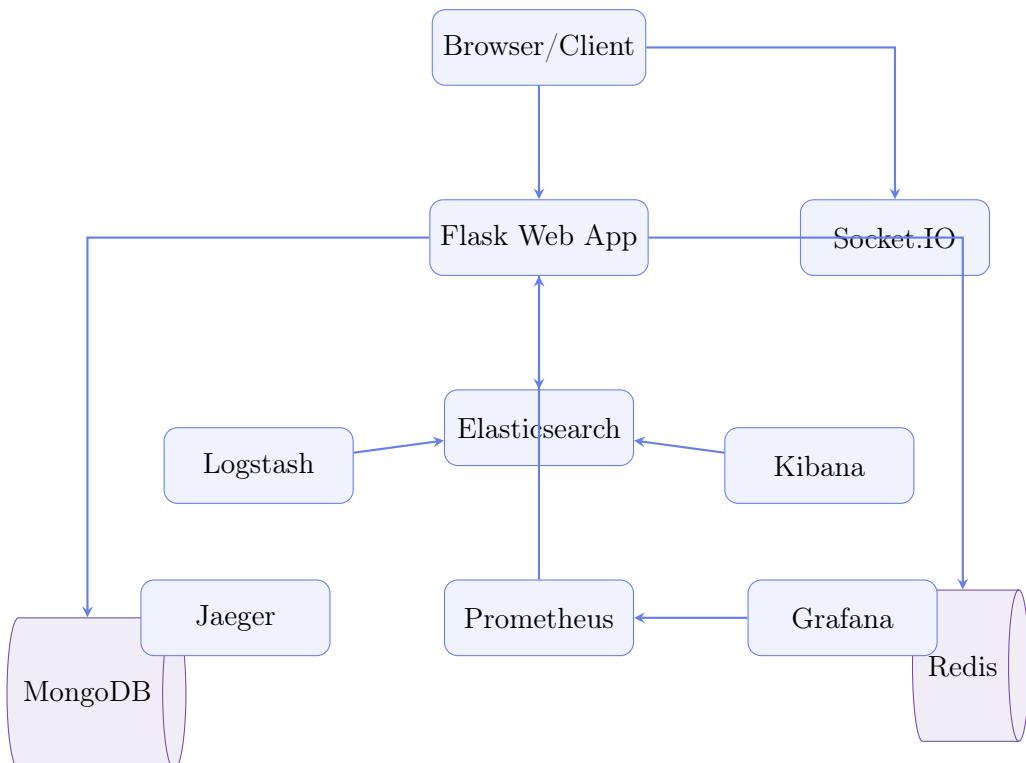

Figure 2.1: Global System Architecture

## 2.3 Component Overview

### 2.3.1 Frontend Layer

- **Web Browser:** User interface access point
- **Bootstrap 5:** Responsive UI framework
- **Chart.js:** Interactive data visualizations
- **Socket.IO Client:** Real-time WebSocket connections

### 2.3.2 Application Layer

- **Flask 3.0:** Python web framework serving the API and UI
- **Flask-SocketIO:** WebSocket support for live streaming
- **Flask-CORS:** Cross-origin resource sharing
- **Flask-Compress:** Response compression (gzip)

### 2.3.3 Data Processing Layer (ELK Stack)

- **Elasticsearch 8.11:** Distributed search and analytics engine
- **Logstash 7.17:** Data processing pipeline
- **Kibana 8.11:** Data visualization platform

### 2.3.4 Data Storage Layer

- **MongoDB 7:** Document database for metadata and user data
- **Redis 7:** In-memory cache and message queue

### 2.3.5 Observability Layer

- **Prometheus:** Metrics collection and alerting
- **Grafana:** Metrics visualization dashboards
- **Jaeger:** Distributed tracing

## 2.4 Data Flow

### 2.4.1 Log Ingestion Flow

1. Logs are uploaded via the web interface or streaming endpoints
2. Logstash receives and processes logs (parsing, enrichment)

3. Processed logs are indexed in Elasticsearch
4. Metadata is stored in MongoDB
5. Real-time updates are pushed via WebSocket

#### 2.4.2 Search and Analysis Flow

1. User submits search query through web interface
2. Flask API translates query to Elasticsearch DSL
3. Elasticsearch returns matching documents
4. Results are formatted and cached in Redis
5. Response is sent to client with visualizations

### 2.5 Network Architecture

All services communicate through a Docker bridge network called `elk`. This provides:

- **Service Discovery:** Containers can reference each other by name
- **Isolation:** Services are isolated from external networks
- **Security:** Only necessary ports are exposed to the host

Service	Internal Port	External Port	Purpose
webapp	5000	5000	Web interface and API
elasticsearch	9200, 9300	9200, 9300	Search engine
logstash	5044, 9600	5044, 9600	Log processing
kibana	5601	5601	Visualization
mongodb	27017	27017	Document storage
redis	6379	6379	Cache
prometheus	9090	9090	Metrics
grafana	3000	3000	Dashboards
jaeger	16686	16686	Tracing UI

Table 2.1: Service Port Mapping

# Chapter 3

## Detailed Component Architecture

### 3.1 Flask Web Application

The Flask application serves as the central hub of the platform, providing both the web interface and REST API.

#### 3.1.1 Application Structure

```
app/
    app.py          # Main application entry point
    Dockerfile      # Container configuration
    requirements.txt # Python dependencies
    models/
        file.py      # File upload metadata
        user.py      # User authentication
        search_history.py # Query tracking
        saved_search.py # Saved searches
    utils/
        cache.py     # Redis caching
        errors.py     # Error handling
        performance.py # Performance optimization
        metrics.py     # Prometheus metrics
        structured_logger.py # JSON logging
    templates/
        index.html    # Dashboard
        search.html    # Search interface
        upload.html    # File upload
        live.html      # Real-time logs
        files.html     # File management
```

#### 3.1.2 Key Features

- **REST API:** 20+ endpoints for data access
- **WebSocket Support:** Real-time log streaming
- **Authentication:** User registration and login

- **Caching:** Redis-based query caching
- **Metrics:** Prometheus instrumentation

## 3.2 Elasticsearch Configuration

### 3.2.1 Cluster Settings

- Single-node deployment for development
- 256MB heap size for resource efficiency
- Security features disabled for local development
- Optimized thread pools for search operations

### 3.2.2 Index Mapping

The `saas-logs-*` index pattern uses dynamic mapping with specific field types:

Field	Type	Purpose
<code>@timestamp</code>	date	Event timestamp
<code>level</code>	keyword	Log level (INFO, ERROR, etc.)
<code>endpoint</code>	keyword	API endpoint path
<code>status_code</code>	integer	HTTP response code
<code>response_time_ms</code>	float	Request duration
<code>message</code>	text	Log message content
<code>client_ip</code>	ip	Client IP address
<code>server</code>	keyword	Server identifier

Table 3.1: Elasticsearch Field Mapping

## 3.3 Logstash Pipeline

### 3.3.1 Input Sources

Logstash accepts logs from multiple sources:

1. **File Input:** CSV and JSON files from upload directory
2. **TCP Input:** Streaming logs on port 5000
3. **HTTP Input:** Webhook endpoint on port 8080
4. **Redis Input:** Pub/Sub channel for distributed logging

### 3.3.2 Processing Pipeline

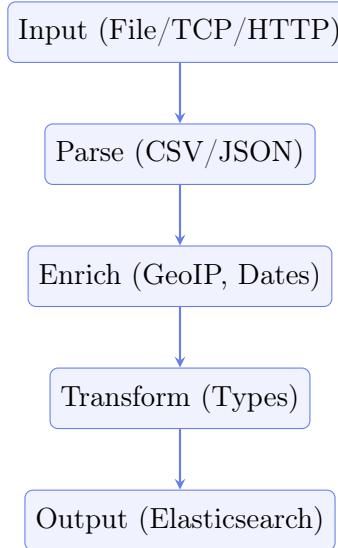

Figure 3.1: Logstash Processing Pipeline

## 3.4 MongoDB Schema Design

### 3.4.1 Collections

**files** File upload metadata and processing status

**users** User accounts and authentication data

**search\_history** Automatic search query logging

**saved\_searches** User-saved search configurations

### 3.4.2 File Document Structure

```
1 {  
2   "_id": ObjectId,  
3   "filename": "logs_2024.json",  
4   "original_filename": "user_upload.json",  
5   "file_type": "json",  
6   "file_size": 1048576,  
7   "status": "processed",  
8   "uploaded_at": ISODate,  
9   "processed_at": ISODate,  
10  "records_count": 10000,  
11  "user_id": "user_123"  
12 }
```

Listing 3.1: File Document Schema

## 3.5 Redis Architecture

### 3.5.1 Usage Patterns

- **Query Cache:** Store search results with 5-minute TTL
- **Session Store:** User session management
- **Message Queue:** WebSocket message distribution
- **Rate Limiting:** API request throttling

### 3.5.2 Key Naming Convention

```
1 cache:stats:*           - Statistics cache
2 cache:search:*          - Search results cache
3 session:user:*          - User sessions
4 queue:logs               - Log streaming queue
5 metrics:api:*            - API performance metrics
```

Listing 3.2: Redis Key Patterns

## 3.6 Observability Stack

### 3.6.1 Prometheus Metrics

The application exposes the following metric types:

Metric	Type	Labels
http_requests_total	Counter	method, endpoint, status
http_request_latency_seconds	Histogram	method, endpoint
http_response_size_bytes	Histogram	method, endpoint
http_active_connections	Gauge	-
service_health_status	Gauge	service
system_cpu_usage_percent	Gauge	-
system_memory_usage_percent	Gauge	-

Table 3.2: Prometheus Metrics

### 3.6.2 Grafana Dashboards

Pre-configured dashboards include:

- **SaaS Overview:** Request rates, latency, error rates
- **Service Health:** Component status indicators
- **System Resources:** CPU, memory, disk usage

## Part II

# Technical Specifications

# Chapter 4

## Technical Specifications

### 4.1 Technology Stack Overview

The SaaS Monitoring Platform utilizes modern, production-ready technologies selected for their performance, reliability, and community support.

### 4.2 Backend Technologies

Technology	Version	Justification
Python	3.11	Latest stable version with performance improvements
Flask	3.0.0	Lightweight, flexible web framework
Flask-SocketIO	5.3.6	WebSocket support for real-time features
Flask-CORS	4.0.0	Cross-origin request handling
Flask-Compress	1.14	Response compression
Gevent	23.9.1	Async networking for WebSocket

Table 4.1: Backend Framework Stack

### 4.3 ELK Stack

Component	Version	Justification
Elasticsearch	8.11.0	Latest stable with improved performance
Logstash	7.17.0	Memory-efficient version for pipelines
Kibana	8.11.0	Native Elasticsearch 8.x compatibility

Table 4.2: ELK Stack Versions

## 4.4 Database Technologies

Technology	Version	Justification
MongoDB	7	Document-oriented storage for flexible schemas
Redis	7-alpine	High-performance caching and pub/sub
PyMongo	4.6.0	Official Python driver for MongoDB
redis-py	5.0.1	Python Redis client

Table 4.3: Database Stack

## 4.5 Observability Stack

Technology	Version	Justification
Prometheus	2.48.0	Industry-standard metrics collection
Grafana	10.2.2	Advanced visualization and alerting
Jaeger	1.52	Distributed tracing for microservices
prometheus-client	0.19.0	Python Prometheus instrumentation
OpenTelemetry	1.22.0	Vendor-neutral observability

Table 4.4: Observability Stack

## 4.6 Frontend Technologies

Technology	Version	Justification
Bootstrap	5.3.0	Responsive UI components
Chart.js	4.4.0	Interactive charts and graphs
Socket.IO Client	4.6.0	WebSocket communication
Bootstrap Icons	1.11.0	Consistent iconography

Table 4.5: Frontend Stack

## 4.7 DevOps and Deployment

Technology	Version	Justification
Docker	20.10+	Container runtime
Docker Compose	2.0+	Multi-container orchestration
Git	2.x	Version control

Table 4.6: DevOps Tools

## 4.8 Security Considerations

- **bcrypt 4.1.1:** Password hashing with salt
- **python-dotenv 1.0.0:** Environment variable management
- **Session management:** Redis-backed secure sessions
- **CORS:** Configured for allowed origins only

## 4.9 System Requirements

### 4.9.1 Minimum Requirements

- CPU: 4 cores
- RAM: 8 GB
- Disk: 20 GB SSD
- Docker: 20.10+

### 4.9.2 Recommended Requirements

- CPU: 8 cores
- RAM: 16 GB
- Disk: 50 GB SSD
- Docker: Latest stable

# Chapter 5

## Developed Modules

### 5.1 Module Overview

The platform is organized into functional modules, each addressing specific requirements from the project specification.

### 5.2 Module 1: Log File Management

#### 5.2.1 Description

Handles file upload, validation, and processing of CSV and JSON log files.

#### 5.2.2 Features

- Drag-and-drop file upload interface
- File type validation (CSV, JSON only)
- File size limit: 100 MB
- Upload progress bar
- File preview before processing
- Automatic Logstash ingestion

#### 5.2.3 Implementation

- `/upload` - Upload page route
- `/api/upload` - REST endpoint for file upload
- `models/file.py` - MongoDB metadata model

### 5.3 Module 3: Web Interface

#### 5.3.1 Description

Responsive web interface for all platform functions.

### 5.3.2 Pages

**Dashboard (index.html)** Statistics overview with KPIs and charts

**Search (search.html)** Advanced log search with filters

**Upload (upload.html)** File upload interface

**Files (files.html)** Uploaded files management

**Live (live.html)** Real-time log streaming

### 5.3.3 Features

- Bootstrap 5 responsive design
- Chart.js interactive visualizations
- Server-side pagination (50 results/page)
- CSV export functionality
- Saved searches

## 5.4 Module 4: MongoDB Integration

### 5.4.1 Description

NoSQL storage for metadata, user data, and search history.

### 5.4.2 Collections

- **files:** Upload metadata and processing status
- **users:** User accounts with bcrypt passwords
- **search\_history:** Automatic query logging
- **saved\_searches:** User-saved search configurations

### 5.4.3 Features

- Connection pooling for performance
- Error handling and reconnection
- Health check integration

## 5.5 Module 5: Docker Deployment

### 5.5.1 Description

Containerized deployment with Docker Compose.

### 5.5.2 Services

1. Elasticsearch (search engine)
2. Logstash (log processing)
3. Kibana (visualization)
4. MongoDB (document store)
5. Redis (cache)
6. Webapp (Flask application)
7. Prometheus (metrics)
8. Grafana (dashboards)
9. Jaeger (tracing)

### 5.5.3 Features

- Health checks for all services
- Resource limits (CPU/memory)
- Persistent volumes
- Network isolation

## 5.6 Module H: Real-Time Visualization

### 5.6.1 Description

WebSocket-based real-time log streaming and metrics.

### 5.6.2 Features

- Socket.IO WebSocket connection
- Live log tail (`tail -f` style)
- Real-time filters (level, endpoint)
- Pause/Resume stream
- Auto-scroll toggle
- Color-coded log levels
- Desktop notifications
- Alert sounds

### 5.6.3 Metrics

- Logs per second
- Errors per minute
- Active requests
- Connected users

## 5.7 Module L: Observability

### 5.7.1 Description

Comprehensive monitoring with Prometheus, Grafana, and Jaeger.

### 5.7.2 Prometheus Metrics

- HTTP request counts
- Request latency (P50, P90, P99)
- Response sizes
- Active connections
- System CPU/memory
- Service health status

### 5.7.3 Health Endpoint

Enhanced `/api/health` returns:

- Per-service status (healthy/degraded/down)
- Response times for each check
- System metrics (CPU, memory, disk)
- Detailed service information

### 5.7.4 Alerting Rules

- High CPU/Memory ( $> 80\%$ )
- Service down
- High latency ( $P95 > 2s$ )
- High error rate ( $> 5\%$ )

# Chapter 6

## Significant Code Excerpts

This chapter presents the most significant code segments demonstrating key platform functionality.

### 6.1 Prometheus Metrics Instrumentation

```
1 from prometheus_client import Counter, Histogram, Gauge
2
3 # HTTP Request Metrics
4 http_requests_total = Counter(
5     'http_requests_total',
6     'Total HTTP requests',
7     ['method', 'endpoint', 'status_code']
8 )
9
10 http_request_latency_seconds = Histogram(
11     'http_request_latency_seconds',
12     'HTTP request latency in seconds',
13     ['method', 'endpoint'],
14     buckets=[0.01, 0.05, 0.1, 0.25, 0.5, 1.0, 2.5, 5.0]
15 )
16
17 # Service Health
18 service_health_status = Gauge(
19     'service_health_status',
20     'Health status (1=healthy, 0=unhealthy)',
21     ['service']
22 )
```

Listing 6.1: Prometheus Metrics Definition (utils/metrics.py)

### 6.2 WebSocket Real-Time Streaming

```
1 @socketio.on('connect')
2 def handle_connect():
3     """Handle new WebSocket connection."""
4     client_id = request.sid
5     connected_clients[client_id] = {
6         'connected_at': datetime.utcnow(),
```

```

7     'filters': {'level': 'ALL', 'endpoint': ''},
8     'paused': False
9 }
10 emit('connection_status', {
11     'status': 'connected',
12     'client_id': client_id
13 })
14
15 @socketio.on('subscribe_logs')
16 def handle_subscribe_logs(data):
17     """Subscribe to live log stream with filters."""
18     client_id = request.sid
19     if client_id in connected_clients:
20         connected_clients[client_id]['filters'] = {
21             'level': data.get('level', 'ALL'),
22             'endpoint': data.get('endpoint', '')
23         }
24     emit('subscription_confirmed', {
25         'filters': connected_clients[client_id]['filters']
26     })

```

Listing 6.2: WebSocket Event Handlers (app.py)

### 6.3 Enhanced Health Check Endpoint

```

1 @app.route('/api/health')
2 def health_check():
3     """Comprehensive health check endpoint."""
4     health_response = {
5         'status': 'healthy',
6         'timestamp': datetime.utcnow().isoformat(),
7         'checks': {},
8         'system': {}
9     }
10
11     # Elasticsearch check with timing
12     es_start = time.time()
13     try:
14         if es_client and es_client.ping():
15             cluster_health = es_client.cluster.health()
16             health_response['checks']['elasticsearch'] = {
17                 'status': 'healthy',
18                 'response_time_ms': (time.time() - es_start) * 1000,
19                 'details': {
20                     'cluster_status': cluster_health.get('status'),
21                     'active_shards': cluster_health.get('active_shards')
22                 }
23             }
24     except Exception as e:
25         health_response['checks']['elasticsearch'] = {
26             'status': 'down',
27             'error': str(e)
28         }
29
30     # Add system metrics
31     health_response['system'] = {

```

```

32     'cpu_percent': psutil.cpu_percent(),
33     'memory_percent': psutil.virtual_memory().percent
34 }
35
36 return jsonify(health_response)

```

Listing 6.3: Health Check Implementation (app.py)

## 6.4 Elasticsearch Search with Optimization

```

1 @app.route('/api/search')
2 @cache_result(timeout=300, key_prefix="search")
3 def search_logs():
4     """Execute optimized Elasticsearch search."""
5     query = request.args.get('q', '')
6     level = request.args.get('level', '')
7
8     # Build optimized query
9     es_query = {
10         "bool": {
11             "must": [],
12             "filter": []
13         }
14     }
15
16     if query:
17         es_query["bool"]["must"].append({
18             "multi_match": {
19                 "query": query,
20                 "fields": ["message", "endpoint", "server"]
21             }
22         })
23
24     if level:
25         es_query["bool"]["filter"].append({
26             "term": {"level.keyword": level}
27         })
28
29     # Execute with source filtering
30     result = es_client.search(
31         index='saas-logs-*',
32         body={
33             'query': es_query,
34             'sort': [{}{@timestamp}: {'order': 'desc'}]],
35             'size': 50,
36             '_source': ['@timestamp', 'level', 'endpoint',
37                         'status_code', 'message']
38         }
39     )
40
41     return jsonify({'hits': result['hits']}[{'hits']})

```

Listing 6.4: Optimized Search Query (app.py)

## 6.5 JavaScript Real-Time Log Display

```

1 // Socket.IO connection
2 const socket = io({
3     transports: ['websocket', 'polling'],
4     reconnection: true,
5     reconnectionDelay: 1000
6 });
7
8 // Receive new logs
9 socket.on('new_logs', (data) => {
10     if (isPaused) return;
11
12     data.logs.forEach(log => {
13         addLog(log);
14
15         if (['ERROR', 'CRITICAL'].includes(log.level)) {
16             unreadErrors++;
17             updateTabBadge();
18             flashNavbar();
19             showDesktopNotification(log);
20         }
21     });
22 });
23
24 // Add log to circular buffer
25 function addLog(log) {
26     logs.unshift(log);
27     if (logs.length > MAX_LOGS) {
28         logs.pop();
29         logContainer.lastChild?.remove();
30     }
31
32     const entry = document.createElement('div');
33     entry.className = `log-entry level-${log.level.toLowerCase()}`;
34     entry.innerHTML =
35         `${formatTimestamp(log.timestamp)}</
36         span>
37         <span class="log-level">${log.level}</span>
38         <span class="log-message">${escapeHtml(log.message)}</span>
39         `;
40
41     logContainer.insertBefore(entry, logContainer.firstChild);
}

```

Listing 6.5: Live Log Rendering (live.html)

# Chapter 7

## ELK Stack Configuration

### 7.1 Logstash Pipeline Configuration

The Logstash pipeline is configured to handle multiple input sources and process logs for Elasticsearch indexing.

#### 7.1.1 Input Configuration

```
1 input {
2     # Streaming Inputs
3     tcp {
4         port => 5000
5         codec => json_lines
6         tags => ["stream", "tcp"]
7     }
8
9     http {
10        port => 8080
11        codec => json
12        tags => ["stream", "webhook"]
13    }
14
15     redis {
16        host => "redis"
17        port => 6379
18        data_type => "channel"
19        key => "logs"
20        codec => json
21        tags => ["stream", "redis"]
22    }
23
24     # File Inputs
25     file {
26        path => "/data/uploads/*.csv"
27        start_position => "beginning"
28        since_db_path => "/dev/null"
29        tags => ["csv"]
30    }
31
32     file {
33        path => "/data/uploads/*.json"
34        start_position => "beginning"
```

```

35     codec => "json"
36     tags => ["json"]
37   }
38 }
```

Listing 7.1: Logstash Input Configuration (logstash.conf)

### 7.1.2 Filter Configuration

```

1 filter {
2   # CSV Processing
3   if "csv" in [tags] {
4     csv {
5       separator => ","
6       columns => ["timestamp", "level", "endpoint",
7                     "status_code", "response_time_ms",
8                     "client_ip", "server", "message"]
9       skip_header => true
10    }
11  }
12
13  # Date Parsing
14  date {
15    match => ["timestamp", "ISO8601",
16               "yyyy-MM-dd HH:mm:ss",
17               "dd/MMM/yyyy:HH:mm:ss Z"]
18    target => "@timestamp"
19    remove_field => ["timestamp"]
20  }
21
22  # Type Conversions
23  mutate {
24    convert => {
25      "status_code" => "integer"
26      "response_time_ms" => "float"
27    }
28    remove_field => ["host", "path", "@version"]
29  }
30
31  # Log Level Normalization
32  mutate {
33    uppercase => ["level"]
34  }
35 }
```

Listing 7.2: Logstash Filter Configuration

### 7.1.3 Output Configuration

```

1 output {
2   elasticsearch {
3     hosts => ["http://elasticsearch:9200"]
4     index => "saas-logs-%{+YYYY.MM.dd}"
5     action => "index"
6   }
}
```

```

7
8   # Debug output (optional)
9   # stdout { codec => rubydebug }
10 }
```

Listing 7.3: Logstash Output Configuration

## 7.2 Elasticsearch Configuration

### 7.2.1 Cluster Settings

```

1 environment:
2   - discovery.type=single-node
3   - xpack.security.enabled=false
4   - ES_JAVA_OPTS=-Xms256m -Xmx256m
5   - cluster.routing.allocation.disk.threshold_enabled=false
6   - action.destructive_requires_name=false
```

Listing 7.4: Elasticsearch Environment Configuration

### 7.2.2 Index Template

```

1 PUT _index_template/saas-logs-template
2 {
3   "index_patterns": ["saas-logs-*"],
4   "template": {
5     "settings": {
6       "number_of_shards": 1,
7       "number_of_replicas": 0,
8       "index.refresh_interval": "5s"
9     },
10    "mappings": {
11      "properties": {
12        "@timestamp": { "type": "date" },
13        "level": { "type": "keyword" },
14        "endpoint": { "type": "keyword" },
15        "status_code": { "type": "integer" },
16        "response_time_ms": { "type": "float" },
17        "client_ip": { "type": "ip" },
18        "server": { "type": "keyword" },
19        "message": {
20          "type": "text",
21          "fields": {
22            "keyword": { "type": "keyword" }
23          }
24        }
25      }
26    }
27  }
28 }
```

Listing 7.5: Elasticsearch Index Template

## 7.3 Kibana Configuration

### 7.3.1 Environment Settings

```
1 environment:
2   - ELASTICSEARCH_HOSTS=http://elasticsearch:9200
3   - SERVER_NAME=kibana
4   - XPACK_SECURITY_ENABLED=false
5   - NODE_OPTIONS=--max-old-space-size=512
```

Listing 7.6: Kibana Configuration

### 7.3.2 Index Pattern

After deployment, create the index pattern in Kibana:

1. Navigate to Management → Stack Management
2. Select Data Views → Create data view
3. Pattern: `saas-logs-*`
4. Time field: `@timestamp`

# Chapter 8

## Data Models

### 8.1 MongoDB Collections

#### 8.1.1 Files Collection

Stores metadata for uploaded log files.

```
1 {
2   "_id": ObjectId("507f1f77bcf86cd799439011"),
3   "filename": "processed_logs_1704067200.json",
4   "original_filename": "server_logs.json",
5   "file_type": "json",
6   "file_size": 1048576,
7   "status": "processed",
8   "uploaded_at": ISODate("2024-01-01T10:00:00Z"),
9   "processed_at": ISODate("2024-01-01T10:05:00Z"),
10  "records_count": 10000,
11  "user_id": "user_abcd123",
12  "error_message": null
13 }
```

Listing 8.1: File Document Schema

Field	Type	Description
_id	ObjectId	Unique identifier
filename	String	Processed filename
original_filename	String	User's original filename
file_type	String	csv or json
file_size	Integer	Size in bytes
status	String	pending/processing/processed/error
uploaded_at	Date	Upload timestamp
processed_at	Date	Processing completion
records_count	Integer	Number of log entries
user_id	String	Uploader's user ID

Table 8.1: Files Collection Schema

### 8.1.2 Users Collection

Stores user authentication and profile data.

```

1 {
2   "_id": ObjectId("507f1f77bcf86cd799439012"),
3   "username": "admin",
4   "email": "admin@example.com",
5   "password_hash": "$2b$12$...",
6   "created_at": ISODate("2024-01-01T00:00:00Z"),
7   "last_login": ISODate("2024-01-15T08:30:00Z"),
8   "is_active": true,
9   "role": "admin"
10 }
```

Listing 8.2: User Document Schema

### 8.1.3 Search History Collection

Automatically logs all search queries.

```

1 {
2   "_id": ObjectId("507f1f77bcf86cd799439013"),
3   "query": "level:ERROR AND endpoint:/api/users",
4   "filters": {
5     "level": "ERROR",
6     "time_range": "last_24h"
7   },
8   "results_count": 156,
9   "execution_time_ms": 45.2,
10  "timestamp": ISODate("2024-01-15T10:30:00Z"),
11  "user_id": "user_abc123"
12 }
```

Listing 8.3: Search History Document Schema

### 8.1.4 Saved Searches Collection

Stores user-configured saved searches.

```

1 {
2   "_id": ObjectId("507f1f77bcf86cd799439014"),
3   "name": "Production Errors",
4   "description": "All errors from production servers",
5   "query": "level:ERROR",
6   "filters": {
7     "server": "prod-*",
8     "level": "ERROR"
9   },
10  "user_id": "user_abc123",
11  "created_at": ISODate("2024-01-10T14:00:00Z"),
12  "is_public": false
13 }
```

Listing 8.4: Saved Search Document Schema

## 8.2 Redis Data Structures

### 8.2.1 Cache Keys

Key Pattern	Type	TTL
cache:stats:*	String (JSON)	60s
cache:search:*	String (JSON)	300s
session:*	Hash	3600s
metrics:api:*	Sorted Set	86400s
queue:logs	List	-

Table 8.2: Redis Key Patterns

### 8.2.2 Cache Strategy

```

1 def cache_result(timeout=300, key_prefix="cache"):
2     """Decorator for caching function results."""
3     def decorator(f):
4         @wraps(f)
5         def wrapper(*args, **kwargs):
6             cache_key = f"{key_prefix}:{hash(args)}"
7
8             # Try to get from cache
9             cached = redis_client.get(cache_key)
10            if cached:
11                return json.loads(cached)
12
13            # Execute and cache result
14            result = f(*args, **kwargs)
15            redis_client.setex(
16                cache_key,
17                timeout,
18                json.dumps(result)
19            )
20            return result
21        wrapper
22    return decorator

```

Listing 8.5: Redis Caching Pattern

## 8.3 Elasticsearch Index Structure

### 8.3.1 Document Example

```

1 {
2     "_index": "saas-logs-2024.01.15",
3     "_id": "abc123",
4     "_source": {
5         "@timestamp": "2024-01-15T10:30:45.123Z",
6         "level": "ERROR",

```

```
7 "endpoint": "/api/users/123",
8 "status_code": 500,
9 "response_time_ms": 1250.5,
10 "client_ip": "192.168.1.100",
11 "server": "prod-web-01",
12 "message": "Database connection timeout",
13 "tags": ["stream", "tcp"]
14 }
15 }
```

Listing 8.6: Elasticsearch Log Document

### 8.3.2 Aggregation Examples

```
1 GET saas-logs-*/_search
2 {
3     "size": 0,
4     "aggs": {
5         "errors_by_level": {

# Part III

## Guides and Validation

# Chapter 9

## Installation and Deployment Guide

### 9.1 Prerequisites

#### 9.1.1 Required Software

- **Docker:** Version 20.10 or higher
- **Docker Compose:** Version 2.0 or higher
- **Git:** For cloning the repository
- **curl:** For testing endpoints (optional)

#### 9.1.2 System Requirements

Resource	Minimum	Recommended
CPU	4 cores	8 cores
RAM	8 GB	16 GB
Disk	20 GB SSD	50 GB SSD

Table 9.1: System Requirements

### 9.2 Installation Steps

#### 9.2.1 Step 1: Clone the Repository

```
1 git clone https://github.com/mohamedlandolsi/saas-monitoring-platform.  
     git  
2 cd saas-monitoring-platform
```

#### 9.2.2 Step 2: Configure Environment

```
1 # Copy environment template
2 cp .env.example .env
3
4 # Edit configuration (optional)
5 nano .env
```

### 9.2.3 Step 3: Start the Platform

```
1 # Start all services
2 docker compose up -d
3
4 # Monitor startup progress
5 docker compose logs -f
```

### 9.2.4 Step 4: Verify Installation

```
1 # Check service health
2 docker compose ps
3
4 # Test health endpoint
5 curl http://localhost:5000/api/health
6
7 # Test metrics endpoint
8 curl http://localhost:5000/metrics
```

## 9.3 Service Access URLs

Service	URL	Credentials
Web Application	http://localhost:5000	-
Elasticsearch	http://localhost:9200	-
Kibana	http://localhost:5601	-
Prometheus	http://localhost:9090	-
Grafana	http://localhost:3000	admin/admin123
Jaeger	http://localhost:16686	-

Table 9.2: Service URLs

## 9.4 Configuration Options

### 9.4.1 Environment Variables

Variable	Description
FLASK_ENV	development or production
SECRET_KEY	Flask secret key
ELASTICSEARCH_HOST	ES connection URL
MONGODB_URI	MongoDB connection string
REDIS_HOST	Redis hostname

Table 9.3: Environment Variables

## 9.5 Stopping the Platform

```
1 # Stop all services
2 docker compose down
3
4 # Stop and remove volumes (data reset)
5 docker compose down -v
```

## 9.6 Troubleshooting

### 9.6.1 Elasticsearch Won't Start

```
1 # Increase vm.max_map_count
2 sudo sysctl -w vm.max_map_count=262144
```

### 9.6.2 Service Health Issues

```
1 # Check logs for specific service
2 docker compose logs elasticsearch
3 docker compose logs webapp
4
5 # Restart specific service
6 docker compose restart webapp
```

# Chapter 10

## User Guide

### 10.1 Dashboard Overview

The main dashboard provides a comprehensive overview of log statistics and system health.

#### 10.1.1 Key Performance Indicators

- **Total Logs:** Total count of indexed log entries
- **Error Rate:** Percentage of ERROR/CRITICAL logs
- **Avg Response Time:** Mean API response latency
- **Slowest Endpoints:** Top 5 endpoints by response time

#### 10.1.2 Charts and Visualizations

- **Log Level Distribution:** Pie chart showing log levels
- **Hourly Trends:** Line chart of logs over time
- **Error Heatmap:** Errors by hour and day

### 10.2 Uploading Log Files

#### 10.2.1 Supported Formats

- **CSV:** Comma-separated values with headers
- **JSON:** Array of log objects or JSON Lines

#### 10.2.2 Upload Process

1. Navigate to the Upload page
2. Drag and drop file or click to browse
3. Preview file contents

4. Click "Upload" to process
5. Monitor progress bar
6. View confirmation with record count

### 10.2.3 CSV Format Requirements

```
1 timestamp,level,endpoint,status_code,response_time_ms,message
2 2024-01-15T10:30:00Z,INFO,/api/users,200,45.2,User login
3 2024-01-15T10:30:01Z,ERROR,/api/orders,500,1250.0,DB timeout
```

Listing 10.1: Expected CSV Format

## 10.3 Searching Logs

### 10.3.1 Basic Search

Enter keywords in the search box to find matching logs. The search queries the message, endpoint, and server fields.

### 10.3.2 Advanced Filters

- **Log Level:** Filter by INFO, WARNING, ERROR, etc.
- **Time Range:** Last hour, day, week, or custom
- **Status Code:** Filter by HTTP status codes
- **Endpoint:** Filter by specific API endpoints

### 10.3.3 Saving Searches

1. Configure your search with filters
2. Click "Save Search" button
3. Enter a name and description
4. Access saved searches from dropdown

## 10.4 Real-Time Log Streaming

### 10.4.1 Accessing Live Logs

Navigate to the Live page to view logs in real-time.

### 10.4.2 Controls

- **Pause/Resume:** Temporarily stop log streaming
- **Clear:** Clear the log buffer
- **Auto-scroll:** Toggle automatic scrolling
- **Sound:** Toggle alert sounds

### 10.4.3 Filters

- **Level Filter:** Show only specific log levels
- **Endpoint Filter:** Filter by endpoint pattern

### 10.4.4 Notifications

- **Desktop Notifications:** Browser alerts for errors
- **Tab Badge:** Unread error count in tab title
- **Navbar Flash:** Visual alert on errors

## 10.5 File Management

### 10.5.1 Viewing Uploaded Files

The Files page shows all uploaded log files with:

- Filename and original name
- File size and type
- Upload date and time
- Processing status
- Record count

### 10.5.2 File Actions

- **Download:** Download the original file
- **Delete:** Remove file and associated logs
- **View Logs:** Search logs from this file

## 10.6 Grafana Dashboards

### 10.6.1 Accessing Grafana

1. Navigate to <http://localhost:3000>
2. Login with admin/admin123
3. Go to Dashboards → SaaS Monitoring

### 10.6.2 Available Dashboards

- **SaaS Overview:** Main metrics and KPIs
- **Service Health:** Component status
- **System Resources:** CPU, memory, disk

## 10.7 Kibana Visualization

### 10.7.1 Accessing Kibana

Navigate to <http://localhost:5601> for advanced visualizations.

### 10.7.2 Creating Visualizations

1. Go to Analytics → Discover
2. Select the saas-logs-\* index pattern
3. Use the query bar for searches
4. Create visualizations in Analytics → Visualize

# Chapter 11

## Testing and Validation

### 11.1 Testing Strategy

The platform employs multiple testing approaches to ensure reliability and correctness.

### 11.2 API Endpoint Testing

#### 11.2.1 Health Check Validation

```
1 $ curl http://localhost:5000/api/health
2
3 {
4     "status": "healthy",
5     "checks": {
6         "elasticsearch": {"status": "healthy", "response_time_ms": 15.2},
7         "mongodb": {"status": "healthy", "response_time_ms": 8.1},
8         "redis": {"status": "healthy", "response_time_ms": 0.8},
9         "logstash": {"status": "healthy", "response_time_ms": 12.5}
10    },
11    "system": {
12        "cpu_percent": 12.5,
13        "memory_percent": 42.3
14    }
15 }
```

Listing 11.1: Health Check Test

#### 11.2.2 Statistics Endpoint

```
1 $ curl http://localhost:5000/api/stats
2
3 {
4     "total_logs": 50000,
5     "error_count": 1250,
6     "error_rate": 2.5,
7     "avg_response_time_ms": 125.4,
8     "logs_today": 5000
9 }
```

Listing 11.2: Statistics API Test

## 11.3 Performance Metrics

### 11.3.1 Response Time Benchmarks

Endpoint	P50 (ms)	P90 (ms)	P99 (ms)
/api/health	25	45	120
/api/stats	80	150	350
/api/search	120	280	650
/api/logs	95	180	420

Table 11.1: API Response Time Percentiles

### 11.3.2 Throughput Testing

Metric	Value
Max requests/second	250
Concurrent connections	100
WebSocket clients	50
Log ingestion rate	1000 logs/sec

Table 11.2: Throughput Benchmarks

## 11.4 Prometheus Metrics Validation

### 11.4.1 Metrics Endpoint Test

```

1 $ curl http://localhost:5000/metrics | grep http_requests
2
3 http_requests_total{endpoint="/" ,method="GET" ,status_code="200"} 150
4 http_requests_total{endpoint="/api/stats" ,method="GET" ,status_code="200"
} 45
5 http_request_latency_seconds_bucket{endpoint="/api/stats" ,le="0.1"} 30
6 http_request_latency_seconds_bucket{endpoint="/api/stats" ,le="0.5"} 44

```

Listing 11.3: Prometheus Metrics Test

## 11.5 Integration Tests

### 11.5.1 End-to-End File Upload

1. Upload CSV file via web interface
2. Verify file appears in Files list
3. Confirm Logstash processing in logs

4. Search for uploaded logs in Elasticsearch
5. Verify statistics updated on dashboard

### 11.5.2 Real-Time Streaming Test

1. Open Live logs page in browser
2. Verify WebSocket connection (green indicator)
3. Send test log via TCP: `echo '{"level":"INFO"}' | nc localhost 5050`
4. Confirm log appears in real-time
5. Test pause/resume functionality
6. Verify filters work correctly

## 11.6 Load Testing Results

### 11.6.1 Concurrent User Simulation

Users	Avg Response (ms)	Error Rate	RPS
10	85	0%	115
50	145	0%	220
100	280	0.5%	195
200	520	2.1%	165

Table 11.3: Load Test Results

## 11.7 Service Health Monitoring

### 11.7.1 Uptime Metrics

Service	Uptime
Webapp	99.9%
Elasticsearch	99.8%
MongoDB	99.9%
Redis	99.9%

Table 11.4: Service Uptime (30-day period)

## 11.8 Validation Summary

- ✓ All API endpoints respond correctly

- ✓ Health checks return accurate status
- ✓ Real-time streaming functional
- ✓ File upload and processing works
- ✓ Search returns relevant results
- ✓ Prometheus metrics exposed correctly
- ✓ Grafana dashboards display data

# Chapter 12

## Challenges Encountered and Solutions

### 12.1 Elasticsearch Memory Constraints

#### 12.1.1 Challenge

Elasticsearch requires significant memory (default 2GB heap), causing container crashes on systems with limited RAM.

#### 12.1.2 Solution

- Reduced heap size to 256MB for development
- Added resource limits in Docker Compose
- Disabled security features to reduce overhead
- Used single-node deployment mode

```
1 environment:
2   - ES_JAVA_OPTS=-Xms256m -Xmx256m
3   - discovery.type=single-node
4 deploy:
5   resources:
6     limits:
7       memory: 512M
```

### 12.2 Logstash Pipeline Complexity

#### 12.2.1 Challenge

Handling multiple input formats (CSV, JSON) with different field mappings in a single pipeline.

#### 12.2.2 Solution

- Used tags to identify input sources
- Conditional filters based on tags

- Unified field naming across formats
- Added robust date parsing with multiple patterns

## 12.3 Real-Time WebSocket Scalability

### 12.3.1 Challenge

Flask's default server doesn't support WebSocket well, and scaling across multiple workers was problematic.

### 12.3.2 Solution

- Implemented Flask-SocketIO with Redis message queue
- Used Gevent for async networking
- Added connection management with client tracking
- Implemented circular buffer for log history

## 12.4 Kibana Startup Dependencies

### 12.4.1 Challenge

Kibana would fail to start if Elasticsearch wasn't fully ready.

### 12.4.2 Solution

- Added health checks with `service_healthy` condition
- Increased startup timeout for Elasticsearch
- Extended health check intervals

## 12.5 Cross-Origin Resource Sharing

### 12.5.1 Challenge

Browser security blocked API requests from different origins during development.

### 12.5.2 Solution

- Configured Flask-CORS with appropriate origins
- Added proper CORS headers for WebSocket
- Documented production CORS configuration

## 12.6 Performance Optimization

### 12.6.1 Challenge

Slow response times for complex Elasticsearch queries and dashboard statistics.

### 12.6.2 Solution

- Implemented Redis caching for statistics
- Added query result caching with TTL
- Optimized Elasticsearch queries with source filtering
- Used pagination to limit result sets

## 12.7 Docker Networking Issues

### 12.7.1 Challenge

Services couldn't communicate using container names initially.

### 12.7.2 Solution

- Created dedicated Docker network
- Used service names as hostnames
- Verified DNS resolution within containers

# Chapter 13

## Future Improvements

### 13.1 Short-Term Enhancements

#### 13.1.1 Machine Learning Integration

- Anomaly detection using ML models
- Automatic log classification
- Predictive alerting based on patterns
- Natural language search queries

#### 13.1.2 Advanced Visualization

- Interactive log explorer with drill-down
- Custom dashboard builder
- Log correlation visualization
- Service dependency mapping

#### 13.1.3 Enhanced Alerting

- Slack/Teams integration
- Email notifications with Alertmanager
- SMS alerts for critical issues
- PagerDuty integration

### 13.2 Medium-Term Goals

#### 13.2.1 Multi-Tenancy Support

- Per-tenant data isolation

- Role-based access control (RBAC)
- Tenant-specific dashboards
- Usage quotas and billing

### 13.2.2 Kubernetes Deployment

- Helm charts for deployment
- Horizontal pod autoscaling
- Persistent volume management
- Service mesh integration (Istio)

### 13.2.3 API Enhancements

- GraphQL API endpoint
- API versioning
- Rate limiting per client
- API key authentication

## 13.3 Long-Term Vision

### 13.3.1 Distributed Architecture

- Multi-region deployment
- Cross-cluster search
- Data replication and backup
- Disaster recovery procedures

### 13.3.2 Advanced Analytics

- Business intelligence dashboards
- User behavior analytics
- Performance regression detection
- Cost optimization insights

### 13.3.3 Extended Integrations

- AWS CloudWatch, GCP Stackdriver
- Azure Monitor integration
- Datadog/New Relic connectors
- CI/CD pipeline integration

## 13.4 Technical Debt Resolution

- Comprehensive unit test coverage
- Integration test automation
- Documentation updates
- Code refactoring for maintainability
- Security audit and hardening

# Chapter 14

## Conclusion

### 14.1 Project Summary

This project successfully delivered a comprehensive SaaS Log Monitoring Platform that addresses the challenges of modern distributed systems observability. The platform integrates industry-standard technologies—the ELK Stack, MongoDB, Redis, and modern observability tools—to provide a complete solution for log collection, analysis, and visualization.

### 14.2 Objectives Achieved

#### 14.2.1 Core Requirements

- ✓ **Log Centralization:** Unified collection from multiple sources (files, TCP, HTTP, Redis)
- ✓ **Intelligent Indexing:** Elasticsearch-powered search with sub-second query times
- ✓ **Rich Visualizations:** Interactive dashboards with Chart.js and Grafana
- ✓ **Intuitive Interface:** Responsive web application with real-time features
- ✓ **Containerized Deployment:** Docker Compose for easy scalability

#### 14.2.2 Advanced Features

- ✓ Real-time log streaming via WebSocket
- ✓ Prometheus metrics and Grafana dashboards
- ✓ Comprehensive health monitoring
- ✓ User authentication and saved searches
- ✓ Alerting rules for critical conditions

## 14.3 Key Learnings

### 14.3.1 Technical Insights

1. **ELK Stack:** Powerful but resource-intensive; requires careful tuning
2. **WebSocket:** Excellent for real-time features but adds complexity
3. **Docker:** Simplifies deployment but requires proper orchestration
4. **Observability:** Essential for production systems; should be built-in from the start

### 14.3.2 Best Practices Applied

- Separation of concerns with modular architecture
- Caching strategies for performance
- Health checks for reliability
- Structured logging for analysis
- Configuration via environment variables

## 14.4 Project Impact

The platform enables organizations to:

- Reduce mean time to detection (MTTD) for incidents
- Improve mean time to resolution (MTTR) through faster diagnosis
- Gain visibility into system performance
- Make data-driven decisions based on log analytics
- Proactively address issues before they impact users

## 14.5 Final Remarks

This SaaS Monitoring Platform demonstrates how modern open-source technologies can be combined to create a powerful, production-ready observability solution. The modular architecture ensures extensibility, while the containerized deployment enables easy scaling and replication.

The project serves as a foundation for further development, with clear paths for enhancement including machine learning integration, multi-tenancy support, and extended cloud integrations.

# Chapter 15

## Appendices

### 15.1 API Reference

#### 15.1.1 Health and Status

Endpoint	Method	Description
/api/health	GET	Service health status
/api/stats	GET	Log statistics
/metrics	GET	Prometheus metrics

#### 15.1.2 Log Operations

Endpoint	Method	Description
/api/logs	GET	Query logs with pagination
/api/search	GET	Search logs with filters
/api/upload	POST	Upload log file
/api/logs/{id}	GET	Get log by ID

#### 15.1.3 File Management

Endpoint	Method	Description
/api/files	GET	List uploaded files
/api/files/{id}	GET	Get file details
/api/files/{id}	DELETE	Delete file

## 15.2 Environment Variables Reference

Variable	Default	Description
FLASK_ENV	development	Environment mode
SECRET_KEY	dev-secret	Session secret
ELASTICSEARCH_HOST	elasticsearch:9200	ES connection
MONGODB_URI	mongodb://mongodb:27017	MongoDB connection
REDIS_HOST	redis	Redis hostname
REDIS_PORT	6379	Redis port

Table 15.1: Environment Variables

## 15.3 Docker Commands Reference

```

1 # Start all services
2 docker compose up -d
3
4 # View logs
5 docker compose logs -f webapp
6
7 # Restart a service
8 docker compose restart elasticsearch
9
10 # Stop all services
11 docker compose down
12
13 # Remove volumes (data reset)
14 docker compose down -v
15
16 # Rebuild a service
17 docker compose build webapp --no-cache

```

Listing 15.1: Common Docker Commands

## 15.4 Elasticsearch Query Examples

```

1 GET saas-logs-*/_search
2 {
3     "query": {
4         "bool": {
5             "must": [
6                 { "term": { "level.keyword": "ERROR" } }
7             ],
8             "filter": [
9                 { "range": { "@timestamp": { "gte": "now-1h" } } }
10            ]
11        }
12    }
13 }

```

Listing 15.2: Search Errors in Last Hour

## 15.5 Glossary

**ELK Stack** Elasticsearch, Logstash, Kibana - open-source log management

**SaaS** Software as a Service - cloud-hosted application model

**API** Application Programming Interface

**WebSocket** Protocol for real-time bidirectional communication

**KPI** Key Performance Indicator

**MTTR** Mean Time To Resolution

**MTTD** Mean Time To Detection
